UNIVERSITAS CIPUTRA
CREATING WORLD CLASS **ENTREPRENEURS**

AFL EXERCISE
2025-2026 EVEN

Department	**: Informatics**
Code	: I**MT01303401**
Subject	**: Mobile Application Development**
Week	**: Week 10**
Learning Outcome and Indicator: - KU3.2 The suitability of the solution and problem. - P1.3 The mastery level of Computer Science/cognition.	

Problem Description

Students were asked to create an application to demonstrate proficiency in using firebase in SwiftUI. Students were tasked to make the following pages:

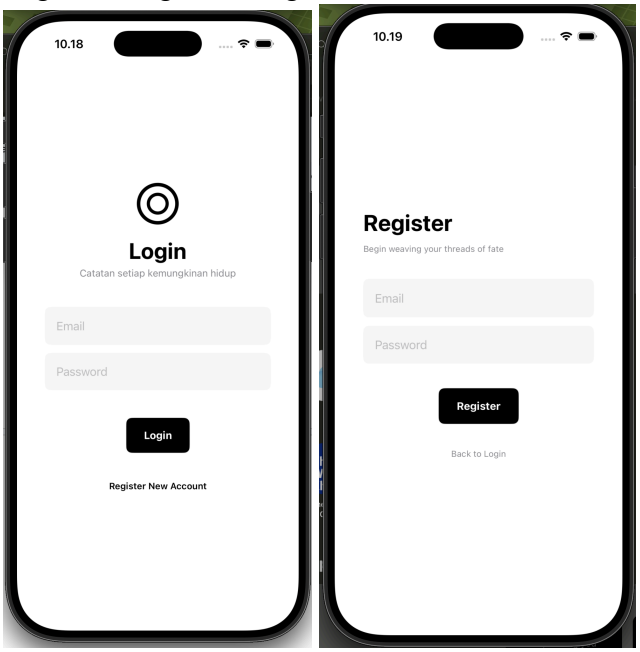
- Login & Register Page
- Home Page
- Gameplay Page
- Admin Page
- Profile Page

Watch this video to see the whole app!
Link App Demo Video:
https://drive.google.com/file/d/1wBA_zUKJUNCL6RIYdSdilVjAVhQ2_sgE/view?usp=sharing

Notes:

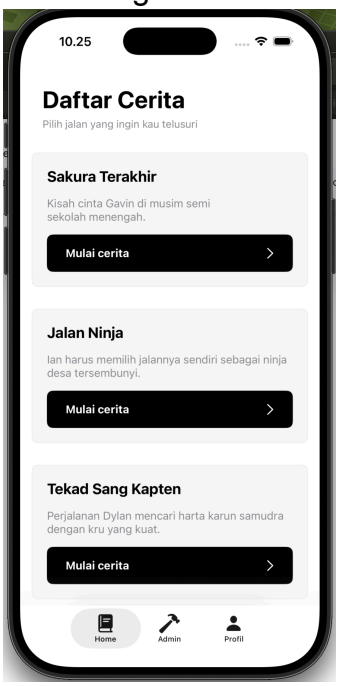
- You can change the UI as long as it is still sensible and has good UI/UX principles

1. Login & Register Page



- Must include text fields for **Login** (Email) and **Password**.
- A button that authenticates the user and navigates them to the **Home Page**.
- Navigation to the **Register Page** via a "Register New Account" link.
- The **Register Page** must include input fields for Name and Email to create a new user profile.

2. Home Page

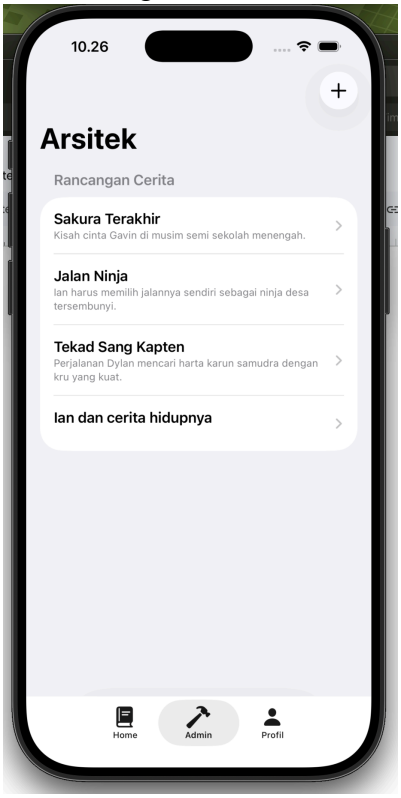


- Displays a list of interactive stories under a "Daftar Cerita" header.
- Each story card must display a title and a brief narrative description.
- A button for each story that initiates the narrative and navigates to the **Gameplay Page**.
- A bottom tab bar to navigate between the **Home Page**, **Admin Page**, and **Profile Page**.

3. Gameplay Page

- Displays the active story text for the user to read (use animation for +5 point)
- Must provide multiple choice buttons to determine the story's direction (e.g., "Meditasi Chakra").
- Each node will have a
- Includes a close button to exit the story and return to the **Home Page**.

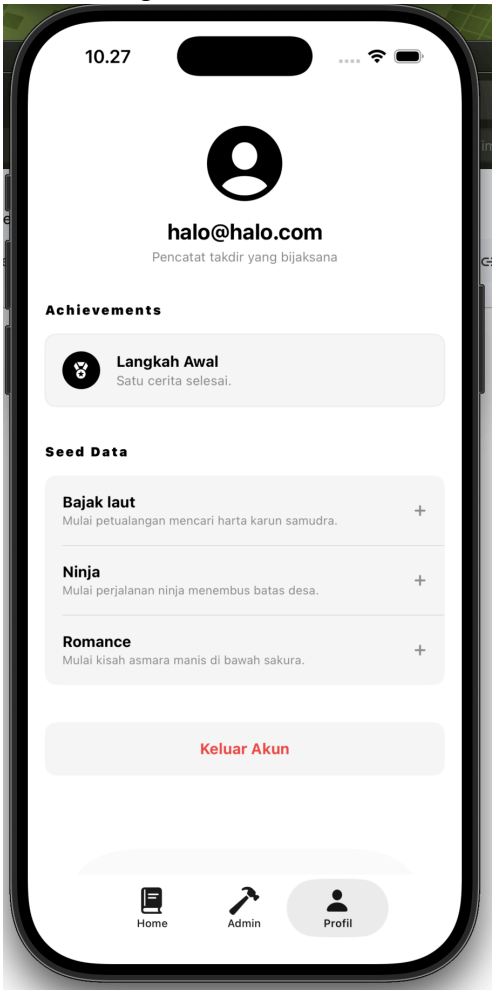
4. Admin Page



- Displays a management interface titled for story design.
- A list view of all current story drafts.
- An add button (+) in the navigation bar to create a new story node with these details:
    - Each new node must include a toggle to set it as the **Main Entry Point** for the story.
    - Each node must support a text field for the narrative and an "Add Choice" feature.
    - Each choice created must include a label and linked to another specific node.

Notes: for more details see the demo video above

5. Profile Page



- Displays the authenticated user's email and a status message.
- An "Achievements" section to track completed stories or milestones.
- A "Seed Data" section to populate the app with specific story categories like Ninja or Romance.
- A "Keluar Akun" button to log out and return the user to the **Login & Register Page**.

Score Description

Criteria	Task	Score
KU3.2 The suitability of solution and problem. Correctness of the code	The app demonstrates perfect Firebase integration. User authentication (Login/Register) works seamlessly with Firebase Auth. All story data, nodes, and choices are successfully fetched from and written to Firestore in real-time. All functionality works perfectly.	100
	The app works and runs without errors. All pages (Home, Gameplay, Admin, Profile) are implemented. Firebase data is loaded correctly, but there are minor logic issues, such as broken navigation links between specific story nodes, no animation or some missing component	90
	The app runs without errors. Authentication works, but the features works partially (e.g., can add a node but cannot link choices to other nodes correctly).	80
	The app runs but has limited Firebase connectivity. It might only use Firebase for static data fetching without supporting user-generated content from the Admin Page, or authentication is simulated rather than integrated.	60
	The app runs minimally. Only 1 or 2 pages successfully communicate with the Firebase backend. Most data is hardcoded rather than dynamic.	40
	The app runs without any firebase integration. All pages are hardcoded rather than dynamic.	20
	No submission is provided, or the app crashes due to critical Firebase configuration errors or missing GoogleService-Info.plist.	0

Criteria	Task	Score
P1.3 The mastery level of Computer Science/cognition. Neatness of the code	The code is very clean, well-structured, and easy to read. Proper use of SwiftUI components and layout structure. Views are separated appropriately (reusable components when needed). The code is efficient and not unnecessarily long and has good comment documentation. Good indentation, spacing, and naming conventions.	100

	The code is clean and readable. Minor repetition or slightly longer structure than necessary. Good organization but can still be improved. Follow best practices.	85
	The code works but the structure is less organized. Some repetition exists. Layout hierarchy could be cleaner. Naming or spacing may be inconsistent. Code length is somewhat excessive.	60
	The code works partially but is messy or difficult to read. Poor structure and organization. Heavy repetition. Improper use of stacks or layout structure. Excessive line count without clear structure.	40
	The code runs minimally but is very messy. Hard to understand structure. No clear separation of components. Poor formatting and inefficient layout usage.	20
	The project does not run. Files contain errors or cannot be previewed. Code cannot be evaluated due to execution failure.	0
